

Social Engineering Project Documentation

Title

Social Engineering Awareness

Project name

Social Engineering in Cybersecurity

Objective

To understand social engineering attacks, identify common techniques, and learn preventive measures.

Problem Statement

People often become victims of cyberattacks because attackers manipulate trust instead of exploiting technology.

Research Findings

Phishing, pretexting, baiting, and tailgating are among the most common social engineering techniques.

Methodology

Collected information from cybersecurity references and analyzed common attack scenarios and prevention methods.

Tools used

Web browser, educational articles, presentation software, and document editor.

Implementation

Studied attack methods, prepared awareness material, and documented preventive practices.

Screenshots

Insert screenshots of phishing email examples, awareness posters, or security training material here.

Results

The project improved understanding of social engineering threats and highlighted safe online behavior.

Challenges

Finding real-world examples while avoiding misleading or unsafe content.

Future Scope

Expand the project with case studies, awareness campaigns, and simulation-based learning.

Conclusion

Social engineering targets human psychology. Awareness, verification, and regular cybersecurity training are the best defenses.
